1. Value

Will it fill more openings?

IN PLAN.MD · OCT 26 · 6 OF 20 HOURS

- **Belief:** a correct list of 3 names fills more openings, even with overnight cancels.
- **Check:** how many of the 44 openings a perfect list could fill, vs. the 12 filled.
- **Ask:** which openings could Tanya act on, and at what time of day?
- **Limit:** only 4 weeks of data, and no December.

WHAT CHANGED

> *The plan bet that the list would help despite overnight cancels. The data says the names were mostly there; the time to use them was not.*

NOW · OCT 30

- **The right people were there.** A fit for 34 of the 44 openings.
- **Few were filled.** 12 of 44 (27%) vs. a 70% target; about $920 a week lost.
- **Timing is the real gap.** 31 of 36 late cancels arrive before Tanya is free at 10:30.
- **Very short notice fails.** 3 had under 2 hours; none was filled.
- **Names must come when the desk can act.** The inbox and call list show them at once.
- **Still unproven.** No past offer results exist; the new report will count refills.

ASSUMPTIONS BEHIND IT

A7 **Names ready the moment a cancel is heard will fill more openings.** Outcome

Why risky	Most cancels land before 10:30, and no past offer results exist to prove it.
If wrong	The platform adds work without lifting refills above 27%.
Check	The report’s refill rate over the first month, vs. 27% today.

2. Feasibility

Can we build it so every name is right?

IN PLAN.MD · OCT 26 · 5 OF 20 HOURS

- **Belief:** simple rules can read the shorthand, repeat lines and dead lines.
- **Belief:** the same rules will work on Friday's new files.
- **Check:** the messy parts first, against Tanya's stale and duplicate marks.
- **Check:** all 44 picks against Tanya's, plus my own new-shorthand lines.

WHAT CHANGED

> *Rules were enough to read the notebook, so we chose a script over AI. The hard part moved from reading notes to getting live data from Kneadly.*

NOW · OCT 30

- **The matcher works on the sample.** 44 of 44 openings, 0 wrong names.
- **A script, not AI.** Same answer every run; unclear lines are held, never guessed.
- **The platform runs locally.** Board, inbox, offers and report, with the same matcher inside.
- **Kneadly is the big unknown.** No answer yet on an API, cancel alerts or holds.
- **Booking history is fragile.** A 2-day file gave wrong names on 35 of 44 openings.
- **Overfitting is possible.** Tuned on 44 openings; new weeks are the real test.

ASSUMPTIONS BEHIND IT

A1 **The matching rules stay right on live data.** Matching

Why risky	Tuned on 44 openings and 60 lines; a gap in booking history gave 35 of 44 wrong.
If wrong	Someone unsuitable, or already booked, gets a call.
Check	Friday's new openings, then every real week added as a test.

A2 **Kneadly can send us live booking data.** Platform · Kneadly

Why risky	Nobody knows if it has an API or cancel alerts; Julie hasn't answered.
If wrong	The platform stays on file uploads and desk taps.
Check	Julie confirms the API, its fields and the plan it needs.

3. Usability

Can a busy desk use it in the time it has?

IN PLAN.MD · OCT 26 · 4 OF 20 HOURS

- **Belief:** anyone can read one opening and know who to call, and why, in 10 seconds.
- **Check:** the order of names can be explained.
- **Ask:** can Tanya or a stand-in try a sample output?
- **Ask:** how do Josée, Kelsey and Dave want their say?

WHAT CHANGED

> *Reading the output was the easy part. The real bar is Tanya's time: about 30 seconds between people, and "less time than the book, not more."*

NOW · OCT 30

- **Output reads at a glance.** Up to 3 names, each with phone and a one-line reason.
- **Order is explainable, not decided.** Default is first asked; Marc and Tanya choose.
- **Therapists' say is partly known.** Josée sees who first; Amira and Rachel unknown.
- **A board replaces the notebook.** Editable cards, no free text. Built Oct 30.
- **Not yet tried by Tanya.** Her timing test decides if the book is retired.
- **Kneadly has no hold.** The desk must block each slot by hand before offering.

ASSUMPTIONS BEHIND IT

A3 **The desk blocks each slot before offering it.** Platform · bookings

Why risky	Kneadly has no hold, so a busy desk must block the time by hand.
If wrong	The slot goes online while offered: a double booking, Marc's first deal-breaker.
Check	Tanya tries it on real openings; the daily check flags any miss.

A4 **Tanya will use the board instead of the notebook.** Platform · adoption

Why risky	She has about 30 seconds between people; it must beat the book on time.
If wrong	Two lists drift apart and the platform falls out of use.
Check	Tanya's 15-minute timing test, then one cut-over date for everyone.

4. Viability

Does it fit the clinic's budget, privacy rules and time?

IN PLAN.MD · OCT 26 · 5 OF 20 HOURS

- **Belief:** it runs under $50 a month, with no health details leaving the desk.
- **Belief:** Julie keeps it running in about an hour a month.
- **Check:** every field that leaves the computer, any AI service, the real cost.
- **Ask:** where does Kneadly store data, and is the $45 plan needed?

WHAT CHANGED

> *A local script removed today's cost and privacy questions. Both come back once the platform connects to Kneadly.*

NOW · OCT 30

- **Today it costs $0.** No internet, AI service or subscription.
- **No health details leave the desk.** Tests check every output file.
- **Julie: about 1 hour a month.** The platform needs more care than the script.
- **Live Kneadly may cost ~$45 a month.** Unchecked; just under Marc's $50.
- **Hosting would break the budget.** Another $5–12 a month, so it stays local.
- **Marc signs off first.** A one-page note before client data goes anywhere new.

ASSUMPTIONS BEHIND IT

A5 Health details never leave the desk computer. Information security

Why risky	Hosting, an AI helper or text-reading would each send data out.
If wrong	Client health data sits with an outside service Marc never approved.
Check	Marc signs a one-page note first; tests scan every output.

A6 It stays under $50 a month and about 1 hour of Julie's time. Cost

Why risky	The ~$45 Kneadly plan is unchecked; a web app needs more care than a script.
If wrong	Marc says no: "A hundred and fifty, no" and "Julie can't babysit it."
Check	Julie checks the real price before connecting; log her hours for a month.
